Power BI DAX _ Measures, Calculations

DAX_ Measures, Calculated columns

- **Required column**: need to add conditional column: add column >>> conditional column>>> IF condition.

1. Attrition rate
   Yes = 1
   No = 0

2. Age Group
   IF:
   <25 = <25
   <35 = 25 - 34 Age group
   <45 = 35 – 44 Age group
   <55 = 45 – 54 Age group
   Else:
   > 55 = >55

3. Distance Travelled
   IF:
   <10 = (0-9) Near
   <20 = (10-19) Far
   <30 = (20-29) Very Far
   Else:
   >30=>30

4. Performance Rating
   3 = Low
   4 = High

5. Job Satisfaction Status
   1 = Highly Dissatisfied
   2 = Dissatisfied
   3 = Satisfied
   4 = Highly Satisfied

6. Work Life Balance Status
   1 = Extremely Challenging
   2 = Challenging
   3 = Manageable
   4 = Satisfactory

7. Years At Company (in total)
   < 2 = 0-1 Years
   <5 = 2-4 Years
   <8 = 5 – 7 Years
   <10 = 8 – 10 Years
   >10 = >10

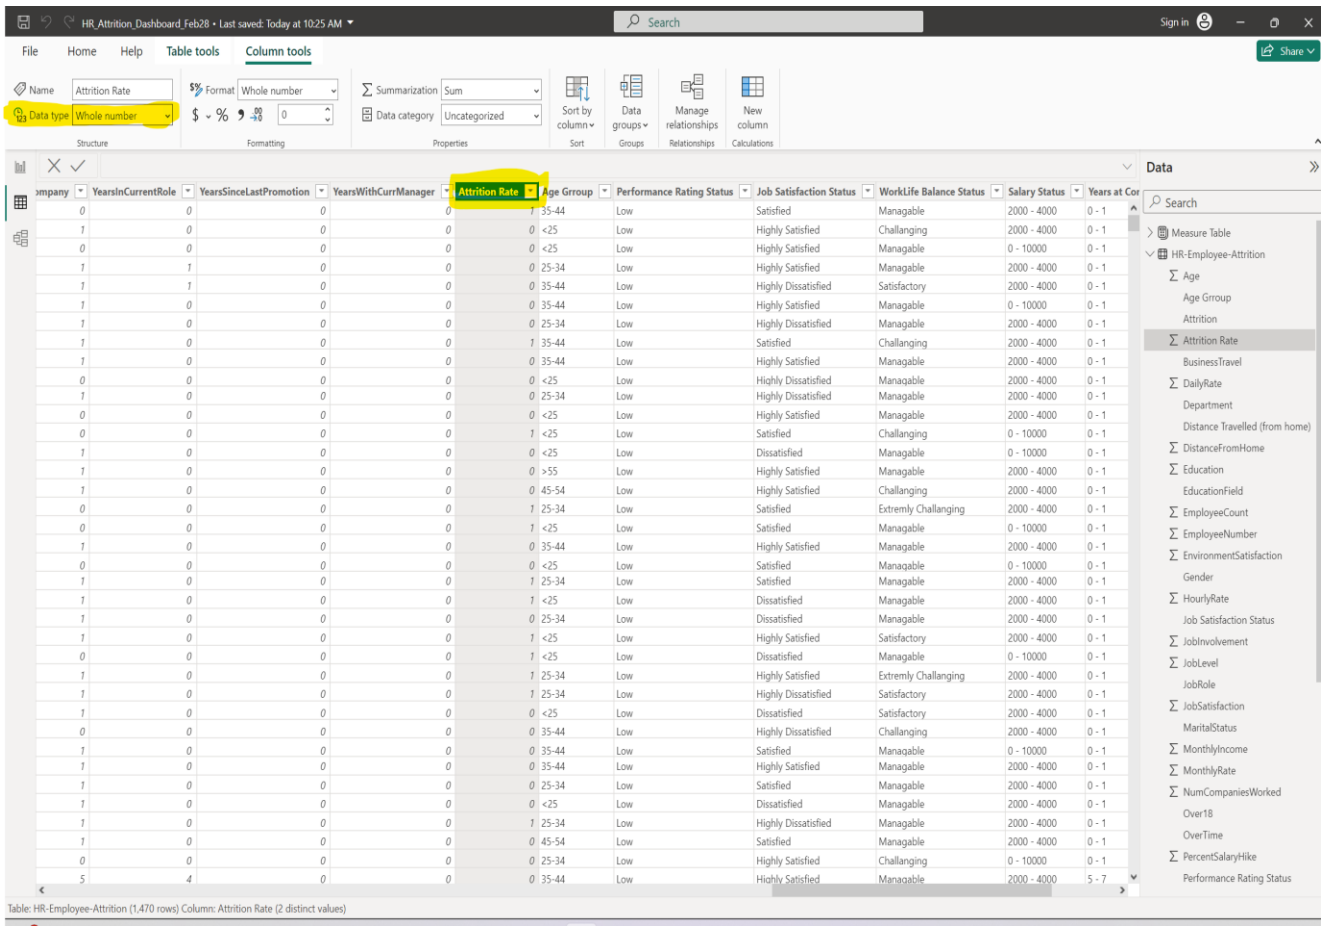
8. Salary Slab
   <2000 = 0-1 k
   <5000 = 2 – 4 k
   <8000 = 5 – 7 k
   <11000 = 8 – 10 K
   >11000 = >11000

Measures or DAX:

```
1. Total Employees = COUNTROWS('HR-Employee-Attrition') // this is the count of total no. of employees
   in the organization//
2. Current Employee = [Total Employees]-[Attrition_Employee] // this calculates total no of current
   employees in the organization//
3. Attrition_Employee = SUM ('HR-Employee-Attrition'[Attrition Rate]) // this calculates no. of
   employees left in the organization//
4. Attrition Percentage = DIVIDE([Attrition_Employee], [Total Employees]) //this calculates attrition
   rate of the organization (it includes all the departments)//
5. Female = CALCULATE ([Total Employees],'HR-Employee-Attrition'[Gender]="Female") // this calculates
   no. of FEMALE employee in the organization //
6. Female Attrition = CALCULATE([Attrition_Employee],'HR-Employee-Attrition'[Gender]="Female")
7. Male = CALCULATE ([Total Employees],'HR-Employee-Attrition'[Gender] = "Male") // this calculates
   total no. of MALE employees in the organization//
8. Male Attrition = CALCULATE([Attrition_Employee],'HR-Employee-Attrition'[Gender]="Male") //this
   calculates the No of total MALE attrition from the overall all attrition percentage//
9. High_Performance_Employees = calculate([Attrition_Employee], 'HR-Employee-Attrition'[Performance
   Rating Status] ="High") // this calculates no of employee performing HIGH in the organization based
   on the attrition of the total employee - that means we want to know how many high performing
   employees have left the job (attrition of HIGH performer)//
10. Low_Performance_Employee = CALCULATE([Attrition_Employee], 'HR-Employee-Attrition'[Performance Rating
    Status] ="low") // this calculates Low performance employees from the total attrition, that means how
    many total LOW Performer from the total attrition employee have left the organization//
11. HR_Current_Employee = CALCULATE ([Current Employee], ('HR-Employee-Attrition'[Department] = "Human
    Resources")) // this calculates no. of current (total no of employees currently working in HR)
    employee for Hr department//
12. Sales_Current_Employee = calculate ([Current Employee], ('HR-Employee-
    Attrition'[Department]="Sales")) // This calculates no of current employee in sales department (Means
    no of employees currently working in sales department), (calculating no of employee in each
    department)//
13. R&D_Current_Employee = CALCULATE ([Current Employee], ('HR-Employee-Attrition'[Department] =
    "Research & Development")) // This calculates no of current employees working in R&D department
    (Means employees currently working in R&D //
```

```
14. HR_Dep_Attrition = CALCULATE([Attrition_Employee], ('HR-Employee-Attrition'[Department]="Human resources"))// (department wise attrition), this calculates no of employees left from HR department, attrition from HR department//
15. Sales_Dep_Attrition = CALCULATE([Attrition_Employee], ('HR-Employee-Attrition'[Department] = "Sales")) // (department wise attrition), this calculates no of employee left attrition) from sales department//
16. R&D_Dep_Attrition = CALCULATE([Attrition_Employee], ('HR-Employee-Attrition'[Department] = "Research & Development")) // (department wise attrition), this calculates no of employees left from the R & D department //
```

Note: change data type as shown below in power quay editor otherwise it will not be able to give correct result in case we do the summation.



Note: how to change slab data which is string & we need to convert it in to whole number. Ex : - 2000 – 400 salary, <25, 25-35 age. In the power query you do not have the capabilities to convert those directly.

So,

Go to add column >> add conditional column >> then write IF condition >>>give slab a number (ex:- <25 = 1, 25-35=2…) >>>> Close & apply
